Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

acid biosynthesis (By similarity).
-! PATHWAY: De novo fatty acid biosynthesis.
-! SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-! FUM: 4'-phosphopantethelne is transferred from CoA to a specific serine of apo-ACP by acpS. This modification is essential for activity because fatty acids are bound in thioester linkage to the sulfhydryl of the prosthetic group (By similarity).
-! SIMILARITY: CONTAINS 1 ACYL CARRIER DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           "Mechanisms of evolution in Rickettsia conorii and R. prowazekii.";

The peptides represented in AAR13803-12 are examples of a generic formula. They are substrates for assaying factor Xa (an enzyme involved in haemostasis). Compared with known substrates they have better affinity, selectivity and/or water solubility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New labelled tri: or tetra:peptide derivs. - substrates for factor Xa assay, with better affinity, selectivity or water

with the proviso that A3=Gly when A4=Lys and A3=Glyc when A4=Arg.
The peptides are used as substrates for the quantitative determn.
of bacterial endotoxins e.g. in physiological fluids, food or
pharmaceuticals. They have higher activity than the known substrate
S-243 which has Gly-Arg as the C-terminal sequence. They are
brepd. by solid phase synthesis.
                                                                                                                                                                                                                                                                             The N-terminal has an alpha-Ac gp., and the C-terminal has a 4-nitroaniline (pNA) gp. The peptide is a specific example of the

```

```
The inventors claims a method for the preparation of a mature polypeptide which involves the enzymatic cleavage of a soluble precursor of the polypeptide using factor Xa. In particular the method is used for the preparation of mature human growth hormone. Eg, Factor Xa is immobilised on a solid insoluble support which is brought into contact with a soluble precursor of the polypeptide, hGH, which has the formula ARR27101.5H3. ARR27102 confers solubility on hGH, and AAR27101 is a tetrapeptide recognised by factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                             ö
                                                     The DNA in AAQ38417 and AAQ38418 encodes blood coagulation factor Xa recognition sequence IEGR (AAR32109). GA is added immediately after the CDS to form restriction enzyme NruI recognition site. A DNA having inverted repeats of the first l1 nucleotides of the CDS is ligated to form a palindrome sequence of 22 nucleotide pairs.
                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is that of the factor Xa cleavage site which was used in the prepn. of a fusion protein comprising the epitope for the Ca++ dependent monoclonal antibody HPC-4 and a protein to be isolated. This fusion protein may be isolated using HPC-4-based affinity chromatography, the protein can be recovered in a single chromatographic step using immobilised HPC-4, and released from the fusion protein by cleavage with factor Xa.
                                                                                                                                                                                                             ;

The coding sequence was fused immediately dowstream of a region coding for a Factor Xa cleavage site (Ile-Glu-Gly-Arg), which was itself in-frame, within the chloramphenical acetyl transferase (CAT) gene and downstream of a lac or tac promoter. Human CT can be recovered from the resulting CAT-(IEGR)-hCT fusion protein by cleavage with Factor Xa. The synthetic hCT could be replaced by sequences coding for other useful polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Prodn. of polypeptide in non-cellular protein synthesis system -
by constructing a fusion gene with chloramphenicol acetyl
transferase gene and opt. cleaving the polypeptide from the
resultant fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó

Novel recognition sites for cattle Factor-Xa are given in AAR06060-12. Such sequences may replace the Factor-Xa recognition sequence (AAR06093) in recombinant fusion proteins to facilitate cleavage by a new serine protease (given in AAR06050).
                                                                                                                                                                            Refolding of polypeptide molecules - using a cyclic process involving denaturing and renaturing conditions to produce a correctly folded prod
